

Foundation Stage

Number

Nursery and Reception

A key priority of any Primary School maths curriculum is to ensure that children develop a strong sense of number and place value. Children will continually encounter numbers in the world around them, whether that be on the bus they took to school this morning or on their front door at home. But the ability to recognise the symbol 5, and name it, is very different from understanding the 'fiveness' of it, and it is the development of this latter skill that is crucial to a child's mathematical ability.

Furthermore, it is important to recognise that just because a child can recite number names in order, does **not** necessarily mean that they can count. As with learning the alphabet, children can recall a sequence of numbers by rote without any real grasp or understanding of what they mean (hence young children often omit numbers as they count). Gaining familiarity with number names through songs and rhymes is of course helpful, but emphasis should be placed on helping children make links between these number names and the number of objects they equate to.

An intuitive sense of number begins at a very early age, and even before they start school, many children can identify one, two or three objects in a group, regardless of whether they can count. This ability to instantly compute the total in a small group of objects derives from stable, mental images of number which have developed over time from a variety of experiences with different patterns of number. For example, a child might immediately recognise the 6 on a dice, domino piece or playing card:

It is possible that the child has memorised this familiar arrangement of 6 dots. Alternatively, they may have mentally sub-grouped them into two sets of 3, fostering an understanding that a number can be composed of smaller parts. In both cases, no actual counting of objects is involved; instead, the child has relied on other mental strategies.

In the Foundation Stage, as well as teaching the children to count objects, significant attention is given to cultivating number recognition and the development of mental representations. In order to do this, much of their experience with number play in the early years will involve concrete, movable objects.

Foundation Stage

Number

Nursery and Reception

Use of **Numicon** is another great way to help children develop mental representations of number.

These experiences and number representations will help children:

Reliably count the number of objects in a set using the numbers one to twenty.

Place numbers in order.

Numicon, in particular, helps children visualise how the size of numbers relate to each other.

Say which number is one more or one less than a given number.

Foundation Stage

Number

Year 1

Children are expected to:

Represent and use number bonds and related subtraction facts within 20. Once a basic number sense has developed for the numbers up to ten (see the Foundation Stage section of the calculation policy), children must establish a **strong sense of 'ten'**. Children will become familiar with the '**tenness'** of ten using a variety of practical resources:

Numicon:

Children should also be made familiar with the **related subtraction facts**:

Ten-Frames:

A ten-frame, like the one below, is a great tool for embedding an understanding of ten. By placing counters in different arrangements on the frame, children can begin to generate **various mental images** of the number ten, as well as how other numbers relate to it.

Addition and Subtraction Key Stage 1

Year 1

A knowledge of **number bonds** is not just about knowing how to make the numbers 10 and 20. Children should also start to investigate ways to make other numbers less than 20. Several resources can aid this learning:

Numicon:

The concrete or pictorial representations of number facts should always be linked to the **abstract** (i.e. the number sentence it relates to).

Double-sided counters:

Red-Yellow counters can be used to help children find out about different ways of making the same number. They may also start to spot patterns.

Part Part Whole

The 'Part Part Whole' model allows children to visualise the concept that numbers are made up of **2 or more parts** (i.e. other numbers)

Year 1

Ten-frames

Ten-frames (and Numicon resources) can naturally lead the eye to addition concepts:

They can also help the children visualise addition doubles:

Year 1

Children should begin to understand **subtraction** as both **taking away** and **finding the difference** between.

A simple **bar model** can help them get to grips with the latter:

The difference between 12 and 9 is 3.

or **12 - 9 = 3**

This model is introduced using concrete objects first (including cards with pictures), which the children can move, before progressing to pictorial representations.

Understand that the equals sign (=) is a sign of equivalence.

Many children develop the misconception that the **answer** to a calculation is on the right hand side of the equals sign. Scales can be used to help children explore the idea that **both sides** of a calculation must **balance**:

It is important that the children experience the **equals sign** (=) in **different positions**. By writing calculations either side of the equals sign (e.g. 2+4=5+1), the children will not just interpret it as meaning 'the answer'

Through all this, the children should start to see that **addition** and **subtraction** are **related operations**.

For example: 7 + 3 = 10 is related to 7 = 10 - 3.

This understanding can be supported with a tens frame:

Year 2

Children are expected to:

Recall addition and subtraction number facts to 20 fluently.

In Year 1, a great deal of emphasis is placed on generating different mental images and internal representations of number, with a view to build up a bank of facts about them. In order to achieve this, a wide variety of concrete and pictorial resources (please see the Year 1 calculation policy for more details) are used to support the children's investigations.

The expectation in Year 2 is that children should now be able to recall these number facts to 20 **from memory**, no longer requiring concrete resources to support them.

Use these addition and subtraction facts to 20 to derive related facts to 100.

Add or subtract a 2-digit number and ones.

Following on from Year 1, multiple ten-frames can be used as a starting point to **add** a **single-digit number** to a **2-digit number**.

The value of practising this strategy on ten-frames first is that it is very visual for the children and facilitates their understanding of how to add across a ten.

By placing the 'ones' frame to the right of the others, you will reinforce their understanding of place value.

Year 2

Add three 1-digit numbers.

Children should use a **number line** or **known number facts** to help them.

$$6 + 8 + 5$$

They may want to change the order of the calculation so that they are able to use facts they are more certain of first. For instance, they may do:

Know that the addition of two numbers can be done in any order (commutative) but that subtraction cannot.

41 + 22 = 63 is the same as 22 + 41 = 63However, 55 - 18 = 37 is NOT the same as 18 - 55

Recognise and use the inverse relationship between addition and subtraction and use this to check calculations and solve missing number problems.

The **inverse** of a function is the **reverse** of it. For example:

The inverse of 8 + 9 = 17 is $\begin{array}{c} 17 - 9 = 8 \\ \text{or} \\ 17 - 8 = 9 \end{array}$ because subtraction is the reverse of addition. $18 + 7 = 11 + \boxed{}$ $35 + \boxed{} + \boxed{} = 100$ $64 - \boxed{} = 49$ $29 = \boxed{} - 24$

Year 2

Solve problems with addition and subtraction, applying their increasing knowledge of mental and written methods.

In particular, children should be given the opportunity to explore the pattern derived from adding odd and even numbers.

Even + Even = Even

Even + Odd = Odd

Odd - Even = Odd

Even - Odd = Odd

And so on...

Vocabulary

+, add, addition, more, plus, make, sum, total, altogether, how many more to make=? how many more is= than=? how much more is=? =, equals, sign, is the same as, tens, ones, partition, multiple of 10, tens boundary, more than, one more, two more= ten more= one hundred more, -, subtraction, subtract, take away, difference, difference between, minus, less than, one less, two less= ten less= one hundred less

Year 3

Children are expected to:

Add and subtract mentally:

- a 3-digit number and ones
- a 3-digit number and tens
- a 3-digit number and hundreds

To grasp these, children must be able to **partition** a 3-digit number into **hundreds**, **tens** and **ones**.

Base10 resources, place value counters and arrow cards can support children with this.

Year 3

When subtracting, children should start by consolidating simple examples of the **expanded columnar method**, whereby the ones and tens in the first number are always **greater than** the second number (in the example below, **4** is greater than **1**, **70** is greater than **20**)

Once the children are familiar with this method, you can introduce the idea of **exchanging**. **Place value counters** or **Base 10** resources can be used to support the children.

With the example 752 - 318, there are currently not enough ones to take away 8.

It is therefore necessary to **exchange** one of the **tens into ones**:

			-	-	4	0						4
	7	0	0	+	5	0	+	12				
	3	0	0	+	1	0	+	8				
	4	0	0	+	3	0	+	4	a.	4	3	4

This gives 12 ones and 4 tens. Now the calculation can be completed as normal.

= 434

Vocabulary

Hundreds, tens, ones, estimate, partition, recombine, difference, decrease, near multiple of 10 and 100, inverse, rounding, column subtraction, exchange. See also Y1 and Y2

Year 4

Children are expected to:

Add and subtract numbers up to 4 digits using the formal written methods of columnar addition and subtraction.

Children should continue to consolidate the **compact columnar addition** method.

They can choose to revert to the **expanded columnar method** at any point if they are experiencing difficulty.

Children should also be able to add numbers with up to **2 decimal places** (at this stage, both numbers should have the **same number of decimal places**):

They should also be able to use the same method to add up more than two numbers with different numbers of digits:

add, addition, sum, more, plus, increase, total, altogether, double, near double, how many more to make..?, how much more?, ones boundary, tens boundary, hundreds boundary, thousands boundary, tenths boundary, hundredths boundary, inverse, how many more/fewer? Equals sign, is the same as.

Year 5

Children are expected to:

Add and subtract whole numbers with more than 4 digits. Children should continue to consolidate their understanding of the **compact columnar addition and subtraction** methods using numbers with more than 4 digits.

They should be able to use the same method to add decimal numbers and to add more than two numbers.

Place value counters could be used initially to support the children's understanding of adding decimal numbers.

Year 5

Add and subtract numbers mentally with increasingly large numbers.

Children should be encouraged to use a variety of different mental maths strategies in order to solve calculations involving large whole numbers and decimals in their head.

They should be able to count on and back in tenths and hundredths. They could use a number line and/or informal jottings to help them.

0.01	0.02	0-03	0.04	0.05	0.06	0.07	0.08	0·09	0.1
0.11	0.12	0.13	0.14	0.15	0.16	0.17	0.18	0.19	0.2
0.51	0.22	0.23	0.24	0.25	0.26	0.27	0.28	0.24	0•3
0.31	0.32	0.33	0.34	0.35	0.36	0.37	0.38	0.39	0-4
0.41	0.42	0.43	0.44	0.45	0.46	0.47	0.48	0.49	0.5

Some calculations may be reordered to make them easier to work with.

For example:

$$4.7 + 5.6 - 0.7$$
 becomes $4.7 - 0.7 + 5.6 = 4.0 + 5.6 = 9.6$

Year 6

Children in Year 6 should continue to develop their mental and written calculation methods for addition and subtraction. They should progress to larger numbers and continue calculating with decimals, including those with different numbers of decimal places.

Please see the Year 5 (or earlier) calculation policy for more information about the mental and written strategies for addition and subtraction they should use.
